 The present sequence represents a Neisseria meningitidis BASB053 polypeptide. The BASB053 polypeptide, or an antibody immunospecific for BASB053 may be identified in a biological sample in order to diagnose a Neisseria meningitidis infection in an animal. The BASB053 polypeptides and polynucleotides may be used as vaccines, for generating an immune response in an animal. A composition comprising at least one antibody immunospecific for BASB053 may be used to treat humans infected with Neisseria meningitidis.

 and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polypucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

 The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella premoitae, Pseudomonas aeruginosa and Enterococcus faccalis. The invention is also useful for the antisense nucleic acids can also be used for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen compologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence is also useful to screen compologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part

 Fraser C, Ga.
Petersen J,
 AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrhaee polynucleotides and polypeptides. AAZ54576 and AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.

The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The cC invention is also useful for the identification of potential new targets CC for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in CC a wide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.

CC of the printed specification, but was obtained in electronic

 Amino acid sequences AAV38499-Y38944 represent Neisseria meningit and N. gonorrhoeae antigenic proteins. They are encoded by open treading frames (ORFs) AAZ11972-Z1358. The antigenic proteins, their fragments, their nucleic acids and antibodies are used diagnosis, prevention (as vaccines) or treatment of Neisseria infections, such as meningitis, septicaemia and gonorrhea. Both organisms are closely related. Fragments of the nucleic acids are useful as hybridisation probes and antisense reagents.

 AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N gonorrheae polynucleotides and polypeptides. AAZ54575 to AAZ54576 and AAZ54616 to AAZ5473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseriab bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
 Neisseria meningitidis; Neisseria gonorrheae; antigen; vaccine; antigenic; diagnosis; immunogenic; infection; meningitis; septicaemia; antibacterial; gene therapy.

 The present invention provides the protein and coding sequences of several genes from Nelsseria meningitidis. These include the dsbA, fhaB, fhuB, rnts, rth17, rth18, rth19, rth20, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent
 Immunogenic polypeptides derived from Neisseria meningitidis and the nucleic acids that encode them, useful for diagnosing and vaccinating against Neisseria infections e.g. bacteremia and meningitis -

 compositions used to treat, palliate or prevent extra-intestinal E. colinfections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
antibacterial and immunosuppressive activity as part of pharmaceutical

 The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dsbA, fhab, thab, rnis, rth17, rth18, rth19, rth21 and tolC genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent

```
represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polymucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polymucleotides of the invention may also be used in gene therapy protocols.

 AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polymucleotides and polypeptides. AAZ54537 to AAZ54576 and AAZ54616 to AAZ55473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polymucleotides of the invention may also be used in gene therapy protocols.

N-PSDB; AAA75745. 2000-602119/57

Novel polypeptides designated BASB 082, 083, 091, 092, and 101 derived from meningococcus bacterium useful for producing vaccines against infections and in diagnostic assays -

Claim 3; Page 102-104; 108pp; English.

The present sequence represents a BASB083 polypeptide. The specification describes BASB082, BASB083, BASB091, BASB092, and BASB0101 polypeptides. The polynucleotides and polypeptides sequence and for diagnostic reagents and for diagnosing N. meningitidis infection. The polynucleotides may be used as hybridisation probe for RNA, cDNA and genomic DNA to isolate full-length cDNAs and genomic clones encoding BASB082, BASB083, BASB091, BASB092 or BASB101 polypeptides and to isolate cDNA and genomic clones of other genes that have a high identity particularly high sequence identity to BASB082, BASB083, BASB091, BASB092 or BASB101 genes. The vaccine compositions are useful for inducing an immunological response in humans. The polynucleotides encoding BASB082, BASB093, BASB091, BASB092 or BASB101 polypeptides are useful in gene therapy to induce an immunological response. The polypeptides are useful for treating upper respiratory tract infection, invasive bacterial diseases, such as bacteremia and meningitis. such as

 B2/D+A- The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, palliate or prevent extra-intestinal E. coli infections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyelonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more
 Sequence
 The invention relates to a library of DNA fragments of Escherichia colistrains comprising polynucleotides (ABA88577-ABA88729 and ABA89533) and encoded proteins (ABB52459-ABB52919 and ABB52954-ABB53094) of natural

 A candidate adhesin (AAR75366) was identified that is a homologue of the IrgA protein of Vibrio cholerae. The adhesin enables Escherichia coli O157:H7, an antibiotic-resistant, virulent and common food-borne pathogen, to adhere to epithalial cells. Recombinant adhesin was obtd. by expression of the encoding sequence (see AR10105) in E. coli HBIOI (past). The adhesin can be used as a vaccine for immunisation of cattle against disease or colonisation of mucosal surfaces by O157:H7, thus increasing the safety of food

 The present invention provides the protein and coding sequences of several genes from Neisseria meningitidis. These include the dabA, fhaB, fhuB, rni5, rhl17, rhl18, rth19, rth20, rth21 and tolc genes. These can be used in the diagnosis and treatment of infection by the bacterium, which can lead to meningitis and bacteraemia, and in vaccines to prevent
 Immunogenic polypeptides derived from Neisseria meningitidis and the nucleic acids that encode them, useful for diagnosing and vaccinating against Neisseria infections e.g. bacteremia and meningitis -

 pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at

 37;
 The invention relates to a library of DNA fragments of Escherichia colistrains comprising polynucleotides (ABA8877-ABA88729 and ABA89533) and encoded proteins (ABB524959-ABB52914) and encoded proteins (ABB52919-ABB52914) of nature B2/D+A-. The polynucleotides have potential antiinflammatory, antibacterial and immunosuppressive activity as part of pharmaceutical compositions used to treat, pallate or prevent extra-intestinal E. coliinfections. The polypeptides are useful for determining the phylogenic group of a given E. coli strain. These polypeptides can detect and treat an undesired development of E. coli, particularly an extra-intestinal infection that include systemic and non-diarrhoeal infections such as septicaemia, pyclonephritis and meningitis this is particularly advantageous as bacterial resistance is increasing with the more frequent use of broad spectrum antibiotics.
 A library of DNA fragments of Escherichia coli strains for the phylogenic determination of a given strain comprises polynucleotides of
 Escherichia coli; B2/D+A-; antiinflammatory; antibacterial; immunosuppressive; extra-intestinal infection; phylogeny; meningitis; systemic infection; non-diarrhoeal infection; septicaemia; pyelonephritis; antibiotic resistance.

 molecules can degrade or transport fumonisin and can reduce the pathogenicity of a fungus producing fumonisin. The plants may be e.g. maize, sorghum, wheat, tomato, soybean, alfalfa, sunflower, Brassica, cotton or rice. The products can also be used as detection reagents for fumonisins and related compounds. AAS91253 represents the Bacterium 2412.1 fumonisin catabolic gene cluster, and AAS91254 to AAS91273 represent isolated nucleic acids from Bacterium 2412.1 which encode AAY80085 to AAY80104. AAZ91286 to AAS91291 represent sequence used in the exemplification of the present invention. AAZ91274 to AAZ91285 are given in the sequence listing from the present specification but are not specifically mentioned further.
 The present invention describes isolated nucleic acid molecules which encode fumonisin degradative enzymes and transporters from a Bacterium 2412.1 fumonisin catabolic gene cluster. The Bacterium 2412.1 was isolated from maize. The nucleic acid molecules can be used for producing an enzyme for detoxifying fumonisin or a structurally related mycotoxin, e.g. in harvested grain, or processed grain which is to be used as animal feed or silage. Ruminal microorganisms transformed with the nucleic acid molecules can be used as probiotic compositions or as feed inoculant compositions. Plants transformed with the nucleic acid
 New isolated nucleic acid molecules which encode fumonisin degradative enzymes and transporters, used for detoxifying fumonisin or related mycotoxin or reducing the pathogenicity of fungi producing fumonisin

 a newly identified mar regulated (NIMR) polypeptide activity. The method comprises contacting an NIMR polypeptide with a test compound under interaction conditions, determining the ability of the compound to modulate the activity or expression of the polypeptide, and selecting the modulators. NIMR nucleic acids and polypeptides are used in the treatment of microbial infections, and in screening for modulators of NIMR expression and activity. These modulators can be used to reduce the infectivity of a microbe on a surface, and the virulence of a microbe in a subject suffering from an infection. AAU29329-AAU29379 represent Escherichia coli NIMR amino acid sequences of the invention.
 Sequence

polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (II) as useful as hybridisation probes, polypeptide (II) sequences. (II) as useful in gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capponaitles, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

 The present invention describes substantially purified human proteins CC (referred to as open reading frame, ORFX, where X is 1-11491 (see Table 1 cc in the specification). ABN15762 to ABN27252 encode the human ORFX CC proteins given in ABP00101 to ABP11500. ORFX proteins are useful for treating or preventing a pathology associated with an ORFX-associated CC disorder in humans, and in the manufacture of a medicament for treating a cc syndrome associated with ORFX-associated disorder: ORFX polynucleotide sequences can be used in gene therapy. ORFX sequences can be used in the treatment of cancer, hyperproliferative disorders, cirrhosis of liver, cp sociasis, benign tumours, keloid, degenerative disorders related to organ cransplantation, cardiovascular diseases, diabetes mellitus, systemic clupus erythematosus, hypertension, hypothyroidism, cholesterol ester storage disease, various immune deficitencies and disorders, rheumatoid clarathritis, autoimmune disorders such as multiple sclerosis, rheumatoid crathritis, autoimmune inflammatory eye disease. ORFX proteins are also useful for treating burns, incisions, ulcers, for treating osteoporosis, on preference in the crathron of treating osteoporosis, or periodontal disease, and for gut

 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving constitutions a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human

 AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAX94318 to AAX94583. AAX91802 to AAX91898 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation

 Pred. No.
 Score
 d. No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
